

Size, err Depth, Matters: Why Do Deep Diving Pools Keep Breaking Records?

When landlocked divers can't travel, turning to diving pools to extend the fun and relaxing sensation of scuba diving can be the exact pressure release valve they need. Some scuba divers question the point of diving in a pool at all. But, since the early 2000s, Nemo 33 has been shaking up preconceived ideas of pool diving's possibilities and utility, and so have its successors.

For ten years, the Belgian deep pool Nemo 33 held the record for the deepest pool in the world, until Y-40 opened in Italy in 2014. Since then, new deep diving pool projects keep popping up, each one promising to be the deepest in the world. With a new deep diving pool about to open in Dubai, is there any point in competing for depth besides free publicity?

Let's do a roundup of the deep diving pools worldwide (all pools deeper than 30 m/100 ft are currently located in Europe). What has been the motivation behind these daring projects? Are there any takeaways for the diving community? Thanks to their 365-days-per-year stable conditions, it would seem so—in most cases.

Nemo 33: Maximum Depth 33 m/108 ft

Pioneers often start as dreamers. **John Beernaerts**, both a civil engineer and a scuba diving instructor, dreamt of recreating French Polynesia's diving conditions right in the heart of Belgium. Beyond the catchy pitch, the idea was to provide divers-in-training with easier and safer conditions than the murky and cold waters of the Belgian quarries.

Being the first to dare building such a deep pool wasn't without challenges. Beernaerts produced the first sketches in 1996, and after three years of engineering studies (21 versions of the facility were simulated) and four years of construction, the pool **opened in 2004**.

Despite being the first to push the limit of what a deep diving pool can be, it is striking to note that Beernaerts wanted to make his project as sustainable as possible. By heating the pool water to 33°C/91°F using solar panels, [Nemo 33](#) uses less energy than a traditional swimming pool, which is usually heated 5°C/9°F lower.

Located in Uccle, in the southern suburbs of Brussels, it quickly became a scuba diver's favorite place for a diving trip during the cold winter months. The pool has an internal volume of 2,500 m³/660,430 gallons and a surface of 20 m/66 ft by 16 m/52 ft. It features five depth platforms at -1.3 m/-4 ft, -2.5 m/-8 ft, -5 m/-16 ft, -10 m/-33 ft, and finally at the bottom of its shaft, -33 m/-108 ft. Scuba divers can also reach two air bells located at -9 m/-30 ft deep.

On many occasions, Nemo 33 has been used as an underwater studio for filming crews, a training facility by security professionals, and a research facility for scientific and medical hyperbaric studies. The diving facility keeps innovating by offering underwater exhibitions and even the possibility to book a table for dinner in the air bubble at 7 m deep in the pool. Thanks to its large reception areas and a renowned Thai restaurant, Nemo 33 has become a popular venue for incentive events and group trips.

When asked about the current race to the deepest pool, Beernaerts answered, "For us, after holding the record for ten years, it's about being the safest diving pool in the world now. I can't deny how much coverage holding the world record got us. We initially had an actual depth of 35 m/114.8 ft. After we lost the record, we decided to go backward and mount a platform at the bottom of the shaft to be precisely at 33 m/108 ft deep, as our name suggests. I remain perplexed about the new projects announcing 50-60 m/164-197 ft deep pools and their goals beyond the publicity. I'm more concerned about the level of awareness about nitrogen narcosis. With clear and warm water, the perceived easiness could tempt beginner divers to descend to depths they shouldn't go. It's vital to remain within the limits of one's training."

Nemo 33 remains the most affordable deep diving pool in the world. A dive for certified divers costs 25€/30 USD, any day of the week. The fins, mask, BCD, and regulator were initially included in the fare, and you had only to bring your dive computer (or rent it at 3€/3.62USD per day). However, to comply with COVID-19 safety rules, Nemo 33 currently encourages divers to bring their gear. Equipment can be rented at 2,50€/3 USD per piece per dive.

Y-40: Maximum depth 42 m/138 ft

With an extra depth of 9 m/30 ft, **Y-40** became the new record holder when it **opened its doors in 2014**. Its founder, **Emanuele Boaretto**, an architect, had dreamed about this project since the 1980s. In 2010, he finally went forward, assisted by scuba and freediving instructor Marco Mardollo. As for a venue, there was no better place than his family's spa/hotel business; Y-40 is, indeed, part of the Hotel Terme Millepini, in Montegrotto Terme, about 50 km/31 miles west of Venice.

While the pool surface has similar dimensions with 21 m/69 ft by 18 m/59 ft, Y-40's pool has an internal volume of 4,135 m³/1,092,351 gallons which is 1.7 times bigger than Nemo 33 in Belgium. It features seven depth platforms at -1.3 m/-4 ft, -5 m/-16 ft, -6 m/-20 ft, -8 m/26 ft, -10 m/33 ft, -12 m/-39 ft, -15 m/-49 ft, and finally at the bottom of its shaft, -42.15 m/-138.3 ft. Its 13 m long transparent tunnel and its 60 m long underwater caves system make the pool a popular attraction for scuba divers coming from all over the world. But what makes Y-40 different, and still to this day, is its water. The spring water is naturally heated geothermally to a tropical temperature up to 34°C/93°F.

With more than a thousand scuba diving certifications per year, Y-40 prides itself on being the world's largest dive center. However, over the years, Y-40 developed a strong reputation among the freediving community. Famous athletes like Alexey Molchanov, Guillaume Néry, and Herbert Nitsch, known for their depth records, have already visited the place. Y-40 can even count on Umberto Pelizzari; the freediving champion, known for his records in all the competitive apnea disciplines, is the president and founder of Y-40's Apnea Academy.

On top of this, like most diving pools, they can cater to filming crews for underwater shooting and security professionals who need training, and they distinguish themselves in the field of scientific and medical hyperbaric studies.

Since opening, the most important diving medicine centers from the United States, Europe, and South Africa have conducted experiments there. The distinguished list includes the [DAN Europe Foundation](#), which led research with the University of Padua on the effects of depth on divers' bodies and, more recently, the [effects and risks of COVID-19 for divers](#).

In 2021, Y-40 opened a medical surgery with doctors with diving expertise. They specialize in hyperbaric medicine, cardiology, neurology, nutrition, dentistry, and otolaryngology.

A dive at Y-40 for certified divers starts at 36€/43.28USD during weekdays and 42€/50.50USD during the weekend. The fins, the BCD, and the regulator are included in the fee. However, you need to bring your mask and dive computer (or rent them at 5€/6USD for a mask and 10€/12USD for a dive computer).

DeepSpot: Maximum depth 45 m/148 ft

The current record-holder for the deepest diving pool was **opened at the end of 2020**. Its founder is **Michał Braszczynski**, the owner of Aerotunel, a facility that simulates skydiving.

Located in Mszczonów, about 50 km/31 miles south of Warsaw, the Deepspot pool has an impressive 8,000 m³/2,113,376 gallon internal volume of 33°C/91°F water. Like Y-40, it features a transparent tunnel suspended into the water and has a cave system for training in overhead environments.

As of 2021, DeepSpot only offers recreational diving and freediving. Four in-house instructors teach a scuba diving and freediving course. And, five hotel rooms have an underwater window view of the pool.

A dive at DeepSpot for certified divers starts at 189 zlotys (zł) (about 42€/50.48USD) during weekdays and 219zł/49€/58.89USD) during the weekend. All equipment is included in the fee, except for the dive computer. You can rent one at the cost of 30zł/7€/8.41USD per dive. Accommodation in the underwater rooms is included in their Sleep & Dive packages, which start at 567zł/126€/151.44USD per night.

Blue Abyss: Maximum depth 50 m/164 ft

The [Blue Abyss](#) project aims to redefine a deep diving pool. While still in the planning phase, we have enough information to get excited about this new contender, which **plans to open in 2023** in Newquay, Cornwall in the United Kingdom.

Its founder, **John Vickers**, a British army veteran and business consultant, launched the project in 2015. With the type of facility he had in mind (he knew even back then that he wanted to reach 50 m/164 ft and work with astronauts), there was no way this project was ever going to be straightforward.

After the Blue Abyss team announced that the construction would begin in Colchester, then in Liverpool, the team finally decided to invest £150M/\$210MUSD in the Cornish Aerohub Enterprise Zone near Newquay Airport to build the giant underwater facility. As announced in a press release on June 2, 2021, Blue Abyss is currently applying for a building permit, which should be completed by the end of the year; construction will take approximately 18 months.

The Blue Abyss diving pool is announced with a surface of 50 m/164 ft by 40 m/131 ft and a 42,000 m³/11,095,226 gallon internal volume, the equivalent of 17 Olympic swimming pools and more than five times bigger than Poland's DeepSpot. With industrial and scientific users in mind, the pool will also be equipped with a sliding roof and a 30 tonne/33 ton crane to allow large objects to be lowered into the pool.

Blue Abyss staff assure that recreational scuba divers, technical divers, and free divers will have ample access to the pool for training. However, the goal is to go beyond what publicly-accessible diving pools have ever achieved before.

The location, Cornwall, is strongly linked to the county's dynamic aerospace and marine offshore energy industry. The connection to aerospace is so strong that British astronaut Major Tim Peake sits on the Blue Abyss Advisory Board and acts as an ambassador of the project.

A few honorable mentions

- SETT (Submarine Escape Training Tank) was the pool that inspired the creation of Nemo 33. Located in **Portsmouth, UK**, it was 30 m/98.4 ft deep and for military use only. It was a training facility used by the Royal Navy to teach soldiers to escape a disabled submarine. Opened after WWII, it just closed at the beginning of 2020.
- While, technically, deep diving pools must reach a minimum depth of 30 m/98.4 ft to earn the title, it's worth mentioning two diving pools in Asia, with K-26 in **South Korea** (26 m/85 ft deep) and **DiveCube** in Taiwan (21 m/69 ft deep).
- Not—strictly speaking—a pool, but you can dive in an old nuclear silo in **Texas, USA**, filled with 39 m/128 ft of water.
- **France** must have the greatest number of diving pools, with twelve 20 m/66 ft pools, five 15 m/49 ft pools, and four 12 m/39 ft pools, mostly built within France's vast network of public swimming pools.
- Duiktank in the **Netherlands** is a 15 m/49 ft pool in an old oil tank, and TODI is a 10 m/33 ft pool in an old coal mine in **Belgium**.
